

only feebly marked. The **angle** is slight, and situated close to the tubercle. The **body** is not twisted, so that both ends touch any plane surface upon which it may be laid; but there is a bend, with its convexity upward, similar to, though smaller than that found in the first rib. The body is not flattened horizontally like that of the first rib. Its **external surface** is convex, and looks upward and a little outward; near the middle of it is a rough eminence for the origin of the lower part of the

FIGS. 124 to 128.—Peculiar ribs.

first and the whole of the second digitation of the Serratus anterior; behind and above this is attached the Scalenum posterior. The **internal surface**, smooth, and concave, is directed downward and a little inward: on its posterior part there is a short costal groove.

Tenth Rib.—The tenth rib (Fig. 126) has only a single articular facet on its head.

Eleventh and Twelfth Ribs.—The eleventh and twelfth ribs (Figs. 127 and 128) have each a single articular facet on the head, which is of rather large size; they
