

sophalangeal joint of the great toe; one sometimes at the metatarsophalangeal joints of the second and fifth toes, one occasionally at the corresponding joint of the third and fourth toes, and one at the interphalangeal joint of the great toe.

Sesamoid bones apart from joints are seldom found in the tendons of the upper limb; one is sometimes seen in the tendon of the *Biceps brachii* opposite the radial tuberosity. They are, however, present in several of the tendons of the lower limb, viz., one in the tendon of the *Peronæus longus*, where it glides on the cuboid; one, appearing late in life, in the tendon of the *Tibialis anterior*, opposite the smooth facet of the first cuneiform bone; one in the tendon of the *Tibialis posterior*, opposite the medial side of the head of the talus; one in the lateral head of the *Gastrocnemius*, behind the lateral condyle of the femur; and one in the tendon of the *Psoas major*, where it glides over the pubis. Sesamoid bones are found occasionally in the tendon of the *Glutæus maximus*, as it passes over the greater trochanter, and in the tendons which wind around the medial and lateral malleoli.
